1 Sequence 86, Application US/09312409

1 Patent No. 64711957

2 GENERAL INFORMATION:

APPLICANT: Sim, Gek-Kee

APPLICANT: Yang, Shumin

APPLICANT: Wonderling, Ramani S.

TITLE OF INVENTION: CANINE AND FELINE IMMUNOREGULATORY PROTEINS, NUCLEIC

TITLE OF INVENTION: CANINE AND FELINE IMMUNOREGULATORY PROTEINS, NUCLEIC

TITLE OF INVENTION: ACID MOLECULES, AND USES THEREOF

FILE REFERENCE: IM-2-C1

CURRENT APPLICATION NUMBER: US/09/312,409

CURRENT FILING DATE: 1999-05-29

EARLIER APPLICATION NUMBER: 60/087,306

EARLIER FILING DATE: 1998-05-29

NUMBER OF SEQ ID NOS: 154

The present invention provides the protein and coding sequences of the canine interleukin-5 (Li-5) protein. This can be used to treat allergies, cancer and inflammatory reactions in dogs. The present sequence is one version of the IL-5 protein shown in the specification
                                                                                                                                                                                                                                      Novel canine interleukin 5 polynucleotide and polypeptides are used for generating antibodies which are useful in treating allergies in dogs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Nucleic acids encoding immunoregulatory proteins from cats or dogs, useful for treating or preventing e.g. tumors or autoimmune disease

canine IL-5, canine or feline CD40, canine or feline CD154 (CD40 ligand), canine IL-5, canine IL-13, feline interferon-alpha (IFN-alpha) and feline granulocyte macrophage colony-stimulating factor (GMSE), and nucleotides which encode these immunoregulatory proteins. The proteins, their associated nucleic acids, specific antibodies and inhibitors may be used as vaccines for therapeutic or prophylactic regulation of an immune response in animals (particularly cats, dogs, horses and humans). They may be used to treat autoimmune or infectious diseases including allergies, tumours, inflammation and graft rejection, and to increase the response from a co-administered antigen. The nucleotide sequences can also be used for the recombinant production of a protein, while conclected fragments are useful as probes, as amplification primers and as sources of inhibitory therapeutics (e.g., antisense oligomucleotides). The proteins may be used to raise antibodies and to screen for modulators of activity, while the antibodies may be used in detection, and in drug

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequences AAY5819-Y58220 represent encoded and mature canine interleukin -5 (IL-5). The invention relates to canine IL-4, canine or feline Flt-3 ligand, canine or feline CD40, canine or feline CD40, canine or feline CD40 ligand).

canine IL-5, canine IL-13, feline interferon-alpha (IFN-alpha) and feline granulocyte macrophage colony-etimulating factor (GMCSF), and nucleotides which encode these immunoregulatory proteins. The proteins, their associated nucleic acids, specific antibodies and inhibitors may be used as vaccines for therapeutic or prophylactic regulation of an immune response in animals (particularly cats, dogs, horses and humane). They may be used to treat autoimmune or infectious diseases including
                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Nucleic acids encoding immunoregulatory proteins from cats or dogs, useful for treating or preventing e.g. tumors or autoimmune disease

       response from a co-administered antigen. The nucleotide sequences can also be used for the recombinant production of a protein, while nucleotide fragments are useful as probes, as amplification primers and as sources of inhibitory therapeutics (e.g., antisense oligonucleotides). The proteins may be used to raise antibodies and to screen for modulators of activity, while the antibodies may be used in detection, and in drug
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention provides the protein and coding sequences of the canine interleukin-5 (Lr-5) protein. This can be used to treat allergies, cancer and inflammatory reactions in dogs. The present sequence is one version of the LL-5 protein shown in the specification

ABG99883;
This protein sequence represents ovine interleukin-5 (IL-5). Ovine IL-5 or IL-12 are used to treat and/or prevent infections in livestock (esp. cows and sheep), particularly where the animals are stressed, e.g. during transport. IL-5 and IL-12 can also be used as adjuvants in vaccines for veterinary use (partic. weakly immunogenic subunit or synthetic peptide veterinary use (partic. weakly immunogenic subunit or synthetic peptide constructs or allargy, to enhance/suppress the reproductive system and to promote growth or early maturity. Optionally interleukin can be delivered from constructs or delivery cells and antibodies are useful in enzyme immunopotentiators, especially IL-5 promotes growth of early constructs or delivery calls and antibodies are useful in enzyme immunopotentiators, especially IL-5 promotes growth of early themostepoietic progenitor cells and generation of cytotoxic cells from thymocytes, also it stimulates production and secretion of IgM and IgA (in synargism with bacterial endotoxin). IL-12 induces production of gamma-interferon by, and proliferation of, T and NK cells and increases the (no-) specific cytolytic lymphocyte response. The genetic constructs can also be used for in vitro production of IL-5 or -12. (Updated on I7-cor-2003 to standardise OS field)

of 103531 base pairs appearing as ABEN04911, or its variant, that it is not a sequence encoding all or part amino acids 1-920 encoded by mon AI as given in the specification. The DNA is the S. cinnamonensis polyketide attains in the specification. The DNA is the S. cinnamonensis polyketide attains of the specification. The DNA is the gene cluster. Also included are a combinant cloning or expression vector comprising the gene cluster, a transformed host cell which has been transformed to contain the gene cluster (and is capable of expressing a corresponding polypeptide), a hybridization probe derived from the gene cluster (for identification and specifically to a region of the monensin gene cluster selected from mon BI, mon BII, mon CI, mon CI, mon H, Mon RI, mon RII, mon T, mon AIX and control expression of a heterologous gene in Streptomyces cinnamonensis, a polypeptide encoded by a portion of the monensin gene cluster control expression of a heterologous gene in Streptomyces cinnamonensis, a mutants, alleles or variants), an epoxidase enzyme encoded by mon CI, an expression of monents, and amonents capable of cyclase enzyme encoded by mon CII, producing S. cinnamonensis capable of enhanced levels of production of monents control expression of m
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            overexpress the mon RI gene, S. cinnamonensis containing multiple copies of the mon RI gene and/or its variants, expressing a gene heterologous to section and compision transforming a gene heterologous to encoding a heterologous gene expressing the gene under control of the activator gene mon RI or actII/orf4 and 13-propyl erythromycin A. The processes and meterials (enzyme systems, nucleic acids and vectors) are useful for preparing polyketides by recombinant synthesis. The polyketides are useful as insecticides, antiblotics, anthelminthics, antifungals, antibacterials or other pharamaceuticals. In particular the gene is useful for the production of moneansin, an antiblotic polybeher polyketide. The present sequence represents a protein encoded by the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher ewkaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL36775) and the encoded proteins (ABB57737-ABB572072). The sequence data for this patent did not form part of the princed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Identifying compounds that influence fat cell number or size for treating or preventing obesity or diabetes by exposing the cell to the agent and identifying fat cell number or size relative to cells not exposed to the
                                                                                                                                                                                               New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell interactions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                    invention relates to an isolated nucleic acid detection reagent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              cell number; fat cell size; obesity; diabetes; anorectic;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ò
                                                  The invention relates to a method of identifying compounds that influence fat cell number or size comprising providing a cell that expresses a gene and an agent, exposing the cell to the agent and identifying fat cell number or size relative to cells not exposed to the agent. The method calso comprises providing an expression vector and an agent, exposing the vector to the agent, detecting a change in expression of the gene contains a change in expression vector not exposed to the agent, treating a subject. The agent comprises an anisense contigued. The subject with the agent comprises an anisense contigued to the agent, detecting binding of the agent, exposing the polypeptide to the agent, detecting binding of the agent to the agent and identifying fat cell number or size in the aubject or a change in an activity of the polypeptide, treating a comprises providing a polypeptide and an agent to the agent comprises an antibody. A method of regulating fat cell subject. The agent comprises providing a subject containing fat cells and an agent that changes the expression of a gene, and treating the subject with the agent under conditions so that fat cell size or number in the comprises providing a subject containing fat cells and an agent that cells number or size in the agent under conditions so that fat cell size or number in the confinence fat cell number or size, for preparing a composition for treating or preventing obssity or diabetes. This sequence represents a fly polypeptide used in the scope of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       cold tolerance; heat tolerance; drought tolerance; herbicide; osmosis; pathogen tolerance; pest tolerance; plant disease resistance; cell cycle pathway modification; plant growth regulator; homologous recombination; seed oil yield; protein yield; carbohydrate; nitrogen; phosphorus; photosynthesis; lignin; galactomannan; bacterial polypeptide.

provide for expression of a polynucleotide encoding a polypeptide from a microbial source. The invention also relates to a transformed plant cell, where the promoter is positioned to provide for expression of a polynucleotide encoding a polypeptide from a comprising the recombinant DNA construct and a method of producing a transformed plant having an improved property comprises transforming a plant with the recombinant DNA construct and growing the transformed plant with the recombinant DNA construct is useful for improving plant with the comprise or polypeptide is useful for improving plant with the improved plant properties, e.g. improved cold, heat or drought tolerance, improved plant properties, e.g. improved cold, heat or drought tolerance, increased resistance to plant disease, better growth rate by modification of the cell cycle pathway with plant growth regulators, increased rate of homologous recombination, modification of carbohydrate, nitrogen or phosphorus use and/or uptake, by modification of photosynthesis or by providing improved plant growth and development under at least one stress content, improved plant growth and development under at least one stress condition, improved plant growth and development under at least one stress condition, improved plant growth and development under at least one stress condition, improved plant production of improved glandcondition or improved form part of the printed specification but was obtained in electronic form.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                        New recombinant DNA construct comprising a promoter positioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source, useful for producing plants with improved properties.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Orotate-phosphoribosyl transferase; URAS gene; SCS7 gene; SEC65 gene; secretory pathway; hybridisation technique; yeast.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ઠે
                                                                                                                      à
                                                                                                                                         셤
                                                                                                                                                                                                                                                                   ö
                                                                              The present invention provides polypeptides encoding a novel orotate-phosphoribosyl transferase (URAS) gene. The invention is useful for producing and selecting yeast strains capable of stable genetic integration of heterologous sequences into a host genome. The invention is also useful for measuring expression of the SCS7 gene and secretory pathway (SECGS) gene and to further characterise the structure and function of this gene and its encoded protein. The nucleic acid fragments of the invention can also be used as probes for various hybridisation techniques. The present sequence is Yarrowia lipolytica SECGS-related
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      į,
            New isolated orotate-phosphoribosyl transferase polynucleotides and polypeptides, useful for producing and selecting yeast strains capable of stable genetic integration of heterologous sequences into a host genome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL36173)-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New isolated nucleic acid detection reagent for detecting 1000 or more
genes from Drosophila and for elucidating cell signaling and cell-cell
                                                                                                                                                                                                                                                                   Gaps

The invention also relates to antibodies against the polypeptides, methods for producing the polypeptides, method for producing the polypeptides, method of penerating vaccines for immunishing an individual against P. mirabilis, a method for evaluating a compound for the ability to bind a P. mirabilis polypeptide and a method for screening test compounds for anti-bacterial activity. The polypeptides and polymucleotides are useful as molecular targets for diagnosing, preventing and treating pathological conditions resulting from bacterial infection, as reagents for diagnosis of bacterial diseases, as components of antibacterial vaccines, as targets for antibacterial diseases, as bio-control agents for plants. This sequence represents a Proteus mirabilis polypeptide of the invention.
ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gарв
                                                                                                                                                                                                                            Gaps

The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of movel antibiotics, the essential genes themselves and the encoded proteins. The prokaryotes used are Escherichia themselves and the encoded proteins. The prokaryotes used are Escherichia to themselves and the encoded proteins are discovery in the invention is also useful for the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be used to identify or expressed proteins, and to obtain antisense nucleic acids equence is also useful to screen for nomologous antisense nucleic acid sequence is also useful to screen for nomologous nucleic acids which are required for cell proliferation in a wide variety of organisms. The present sequence represents an essential prokaryotic cellular proliferation protein. Note: The sequence data for this patent calculation format directly from WINDO at the was obtained in the wipo int/pub/published_pot_sequences
   Antisense; prokaryotic cellular proliferation protein; antibiotic; antibacterial; drug design.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Score 39; DB 4; Length 804; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a recombinant DNA construct comprising a promoter functional in plants operably linked to an oil-associated gene. The construct is useful for transgenic plant seed which has in its genome the construct, that is functional in the plant to transcribe the oil-associated gene. The transgenic plant seed grows into a plant having enhanced seed oil as compared to wild type. The construct is useful for producing hybrid maize seed. The transgenic plant seed is useful for producing wegetable oil. The present sequence represents the amino acid sequence of an oil-associated gene related protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel recombinant DNA construct comprising a promoter functional in plants operably linked to an oil-associated gene for producing transgenic plant seed.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

Recombinant DNA

```
the interestance of an interest and in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated or lits fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting callular or proliferation or the activity of a gene in an operon required for proliferation, (7) identifying a compound that influences the activity of required for proliferation, or that inhibits cellular proliferation; (8) identifying a gene required for cellular proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound a activity; (11) a compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling the extent or product is overexpressed or underexpressed; (12) determining the extent to broadcut is overexpressed or underexpressed; (12) determining the extent or proliferation of an organism. The antisense nucleic acids are useful for dentifying proteins or screening for homologous nucleic acids required for proliferation of an organism. The antisense nucleic acids are quired for proliferation of an organism. The antisense nucleic acids are quired for proliferation of an organism. The antisense nucleic acids are quired for an organism or propour and provent and organism. The antisense nucleic acids are quired for an organism to propour and the propounce or product and acts or antised and acids are quired for an organism. The antisense manufacturing and actional actional actional actional actional actional actions or several actional actions or several action
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at fixed by the printed specification, but was obtained ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New antisense nucleic acids, useful for identifying proteins or screening
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to an isolated nucleic acid comprising any one of
Antisense; prokaryotic essential gene; cell proliferation; drug design.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Zyskind JW;
Xu HH;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Haselbeck R, Ohlsen KL,

```
The invention relates to a recombinant DNA construct comprising a promoter functional in a plant cell, where the promoter is positioned to provide for expression of a polynuclectide encoding a polypeptide from a microbial source. The invention also relates to a transformed plant comprising the recombinant DNA construct and a method of producing a cransformed plant having an improved property. The plant is a crop plant such as maize or soybean. The method of producing a transformed plant cannot be a compinant DNA construct and growing the transformed plant, where the combinant DNA construct is useful for improving plant with the improved plant properties. The recombinant DNA construct is useful for producing plants with cingroved plant properties, e.g. improved cold, heat or drought tolerance, increased resistance to plant disease, better growth rate by modification of the cell cycle pathway with plant growth regulators, increased rate of homologous recombination, modified seed oil or protein yield and/or content, improved yield by modification of carbohydrate, nitrogen or phosphorus use and/or uptake, by modification of photosynthesis or by providing improved plant growth and development under at least one stress condition, improved plant growth and development under at least one stress condition.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 production. This sequence represents a bacterial polypeptide used in t
scope of the invention. Note: The sequence data for this patent did no
form part of the printed specification but was obtained in electronic
format from USPTO at segdata.uspto.gov/sequence.html.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Length 711;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Score 38.5; DB 8;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention describes substantially purified human proteins (referred to as open reading frame, ORFX, where X is 1-11491 (see Table 1 in the specification). ABNI5762 to ABN27252 encode the human ORFX proteins given in ABP00101 to ABP11500. ORFX proteins are useful for treating or preventing a pathology associated with an ORFX-associated disorder in humans, and in the manufacture of a medicament for treating a syndrome associated with ORFX-associated disorder. ORFX polynucleotide content of cancer, hyperproliferative disorders, cirrhosis of liver, content of cancer, hyperproliferative disorders, cirrhosis of liver, conteoarthritis, neurodegenerative disorders, disorders related to organ transplantation, cardiovascular diseases, diabetes mellitus, systemic cransplantation, cardiovascular diseases, diabetes mellitus, systemic cransplantation, hypertension, hypothyroidism, cholesterol ester storage disease, autoimmune disorders multiple sclerosis, infectious disease, autoimmune thyroiditis, myasthenia gravis, graft-versus-host disease and autoimmune thyroiditis, myasthenia gravis, graft-versus-host cuseful for treating burns, incisions, ulcers, for treating osteoporosis, bone degenerative disorders, nor periodontal disease, and for gut creption or regeneration and treatment of lung or liver fibrosis, crepticulo or regeneration and treatment of lung or liver fibrosis, crepticulation injury in various tissues and conditions resulting from crepticulation thyroid the specification, but was obtained in electronic form part of the printed specification, but was obtained in electronic

The invention relates to an isolated nucleic acid comprising any one of
the 6213 antisense sequences given in the specification where expression
of the nucleic acid inhibits proliferation of a cell. Also included are:
(1) a vector comprising a promoter operably linked to the nucleic acid
encoding a polypeptide whose expression is inhibited by the antisense
concleic acid, (2) a host cell containing the vector; (3) an isolated
concleic acid, (2) a nost cell containing the vector; (3) an isolated
contributed by the antisense concleic acid, (4) an antibody capable of specifically binding
the polypeptide or the activity of a gene in an operon required for
proliferation or the activity of a gene in an operon required for
concliferation, (7) identifying a compound that influences the activity of
the gene product or that has an activity against a biological pathway
required for proliferation, or that inhibits cellular proliferation; (8)
confernifying a gene required for cellular proliferation or the biological
contains acts; (9) manufacturing an antibiotic; (10) profiling a
compound's activity; (1) a culture comprising strains in which the gene
conduct is overexpressed or underexpressed; (12) determining the extent
to which each of the strains is present in a culture or collection of
                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Antisense; prokaryotic essential gene; cell proliferation; drug design.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a substantially purified nucleic acid molecule encoding a nitrite reductase of SEQ ID NO. 11926. Further disclosed is a recombinant DNA construct for expression of a nitrite reductase gene in a plant cell, and a plant cell comprising the recombinant DNA construct. The nucleic acid is useful for determining gene expression, identifying mutations in a gene of interest, and for constructing mutations in a gene of interest. Sequences given in records for SEQ IDS 9692-16825 represent a group of 7134 Mxycococcus xanthus proteins and peptides. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from USPTO
proliferation of an organism. The antisense nucleic acids are useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential spenes. Note: The sequence data for this patent did not form part of the princed specification, but was obtained in electronic format directly from WIPO at

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to Enterococcus faecalis polynucleotides and polypeptides. The invention also relates to a recombinant expression vector comprising a polynucleotide operably linked to a transcription regulatory element, a cell comprising a recombinant vector, a method for producing an E. faecalis polypeptide, an isolated nucleic acid comprising a sequence not given in the specification, a recombinant vector. The polynucleotides can be used to detect the presence of E. faecalis the polynucleotides can be used to detect the presence of E. faecalis in a sample. The sequences are useful for preparing a composition for represents an E. faecalis polypeptide of the invention. This sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        polypeptide, useful for preparing a composition for diagnosing or treating E. fecalis infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

The invention relates to Pseudomonas aeruginosa polypeptides and the polynucleotides encoding them. The sequences are useful in diagnosis and the polynucleotides encoding them. The sequences are useful in diagnosis and the restrict of pathological conditions resulting from a prophylaxis and treatment of pathological conditions resulting from a carterial infection, for evaluating a compound, such as a polypeptide, for for the ability to bind a P aeruginosa nucleic acid, as components of effective antibacterial targets as targets for antibacterial drugs, including anti-p. aeruginosa drugs, as templates for recombinant or production of P. aeruginosa and/or treatment of P. aeruginosa, as target components for diagnosis and/or treatment of P. aeruginosa caused infection, and in detection of P. aeruginosa sequences ABO67826.

ABO84396 represent P. aeruginosa polypeptides of the invention. Note: The sequence data for this patent did not form part of the printed sequence attains and the constant and con
                                                                                                                                                                                                                                                                                                                                                                                                                        Novel isolated nucleic acid encoding Pseudomonas aeruginosa polypeptide, useful as molecular targets for diagnostics, prophylaxis and treatment of pathological conditions resulting from bacterial infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Escherichia coli; B2/D+A-; antiinflammatory; antibacterial; immunosuppressive; extra-intestinal infection; phylogeny; meningitis; systemic infection; non-diarrhoeal infection; septicaemia;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present sequence is that of AtAXC1, an acyl-CoA oxidase (ACOX) of Arabidopsis thaliana. ACOX enzymes catalyzes the initial step of fatty acid beter-oxidation. The invention provides ACOX and 3-Keroacyl-CoA thiolase (thiolase) isolated DNA sequences (see AAA89273-85) and encoded polypeptides (see AAB1999-820011), and methods of producing such polypeptides using recombinant methods in host (bacterial, insect, mammalian and especially plant) cells. Expression of ACOX and/or thiolase in a plant can be increased or suppressed using nucleic acid constructs in sense or antisense orientation. This provides a means of manipulating the content and composition of fatty acids and compounds containing such fatty acids, such as oils, waxes, fats and storage proteins. Suppression of ACOX and/or thiolase expression also provides a means of inhibiting or postponing seed germination
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Polynucleotide encoding proteins involved in fatty acid beta-oxidation, useful for modifying oil or lipid composition in host plant cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Bacterial infection; Pseudomonas aeruginosa infection; antibacterial.

                                                                                                                                                                                                                                                                                                                                                            ò
                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                  The invention relates to a library of DNA fragments of Escherichia colistrains comprising polynucleotides (ABA88577-ABA889729 and ABA89533) and encoded proteins (ABB52452-ABB52994) of nature B2/D+A-. The polynucleotides have potential antiinflammatory, antibacterial and immunosuppressive activity as part of pharmaceutical compositions used to treat, palliate or prevent extra-intestinal E. coliinfections. The polypeptides are useful for determining the phylogenic group of a given E. coli strain. These polypeptides can detect and treat an undesired development of E. coli, particularly an extra-intestinal infection that include systemic and non-diarrhoeal infections such as septicaemia, pyelonephritis and meningitis this is particularly advantageous as bacterial resistence is increasing with the more frequent use of broad spectrum antibiotics
                                                                                    A library of DNA fragments of Escherichia coli strains for the phylogenic determination of a given strain comprises polynucleotides of nature B2/D +
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Novel isolated nucleic acid encoding Pseudomonas aeruginosa polypeptide, useful as molecular targets for diagnostics, prophylaxis and treatment of pathological conditions resulting from bacterial infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Bacterial infection; Pseudomonas aeruginosa infection; antibacterial.

The invention relates to Pseudomonas aeruginosa polypeptides and the polymucleotides encoding them. The sequences are useful in diagnosis and therapy of pathological conditions, as molecular targets for diagnostics, prophylaxis and treatment of pathological conditions resulting from a bacterial infection, for evaluating a compound, such as a polypeptide, or the ability to bind a P. aeruginosa nucleic acid, as components of effective antibacterial targets, as targets for antibacterial drugs, including anti-P. aeruginosa drugs, as templates for recombinant or production of P. aeruginosa derived peptides or polypeptides, as target components for diagnosis and/or treatment of P. aeruginosa-caused infection, and in detection of P. aeruginosa sequences or other sequences of Pseudomonas species using biochip technology. Sequences ABO67826-ABO84396 represent P. aeruginosa polypeptides of the invention. Note: The sequence data for this patent did not form part of the printed specification but, was obtained in electronic format from USPTO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    χoα
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Delivery mechanism; cell transduction; cancer; Alzheimers disease; barkinsons disease; hypercholestercolemia; cystic fibrosis; anemia; diabetes; arthritis; autoimmune disease; pollodystrophia cerebri progressiva infantilis; pollodystrophia cerebri progressiva infantilis; antiparting cerebri progressiva infantilis; antiparkinsonian; antilipemic; CNS-Gen.; respiratory-gen.; antianemic; antidiabetic; antiarthritic; immunosuppressive.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Composition for packaging polynucleotide, comprises recombinant polynucleotide-packaging polypeptide having high mobility group (HMG) domains and protein transduction domain operably linked to organelle
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

cc box domains and a protein transduction domain operably linked to a targeting signal for directing the recombinant polymolectide—packaging polypeptide to an intracellular organelle, where the polypeptide comprising the recombinant polymolectide and packages the polymolectide for delivery to the targeted organelle. The invention also relates to a recombinant high mobility protein or its fragment comprising a protein transduction domain operably linked to a targeting signal for a non-nuclear organelle, where the recombinant high conditions and packages the polymucleotide for delivery to the non-conditions and packages the polymucleotide for delivery to the non-conditions and packages the polymucleotide for delivery to the non-conditions and packages the polymucleotide for delivery to the non-conditions and package the polymucleotide for delivery to the non-conditions and package the polymucleotide where the recombinant polypeptide combining a polymucleotide with an amount of a recombinant polypeptide sufficient to package the polymucleotide, where the recombinant conditions are useful for the conganelle targeting aignal, a method of treating a polymucleotide to an organelle of a cell and a method of treating a polymucleotide to an organelle of a cell and a method of treating a polymucleotide to an organelle of a cell and a method of treating a polymucleotide to an organelle of a cell and a complex compirating an amount of a recombinant polypeptide of secure compositions are useful for treating gene related diseases or cells with a complex comprising an amount of a recombinant polypeptide of succimmune diseases, and for treating diseases caused by mitochondrial cytopathy and mypacholesterolemia expericfibrosis, anemia, diabetes, arthritis and autochondrial chefects or abnormalities such as Alpera glasses or atthition of composition signal used in the scope of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ä
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human, open reading frame, ORFX, gene therapy, cancer, cirrhosis, hyperproliferative disorder; psoriasis, benign tumour; haemorrhage; degenerative disorder; osteoarthritis, neurodegenerative disorder; cardiovascular disease; diabetes mellitus; systemic lupus erythematosus; hypertension; hypothyroidism; cholesterol ester storage disease; immune deficiency; immune disorder; infectious disease;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

The present invention describes substantially purified human proteins (referred to as open reading frame, ORFX, where X is 1-11491 (see Table 1) in the specification). ABN15762 to ABN27222 encode the human ORFX proteins given in ABP001010 to ABP11500. ORFX proteins are useful for treating or preventing a pathology associated with an ORFX-associated disorder in humans, and in the manufacture of a medicament for treating a squences can be used in gene therapy. ORFX sequences can be used in the treatment of cancer, hyperproliferative disorders, cirrhosis of liver, or treatment of cancer, hyperproliferative disorders, inchosis of liver, or treatment of cancer, hyperproliferative disorders, inchosis of liver, coreoarchritis, neurodegenerative disorders, disorders related to organ transplantation, cardiovascular diseases, disbetes mellitus, systemic storage disease, various immune deficiencies and disorders, infectious diseases, autoimmune inflammatory eye disease. ORFX proteins are also carbritis, autoimmune inflammatory eye disease. ORFX proteins are also useful for treating burns, incisions, ulcers, for treating osteoporosis, bone degenerative disorders, or periodontal disease, and for gut to regenerative disorders, or periodontal disease, and for gut creperfusion injury in various tissues and conditions resulting from systemic cytokine damage. N.B. The sequence data for this patent did not form attach and propertication, but was obtained in electronic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Eosinophil differentiation factor - with eosinophil differentiation activity and B cell growth promoting activity of B cell growth factor II.
              The present sequence represents a truncated T cell replacing factor (full length given in AMY2247) having B cell growth factor activity. A method has been developed for the preparation of B cell differentiation activating factor (also designated BCGF, B cell growth factor, T cell replacing factor and TRF). The method comprises producing a protein by culturing a transformed cell introduced by a plasmid containing a DNA coding B cell differentiation activating factor. The method is used for the large scale preparation of B cell differentiating factor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The EDF gene product is a novel interleukin, useful in the study of haemopoiesis and B-cell differentiation, and may have utility in MAb production. If may be used therapuetically in regulation of the immune response, and promotion of eosinophilia. See also AAN71243. (Updated on 25-MAR-2003 to correct PA field.)

                                                                                                                                                                                                                                                             The present sequence is that of an N-terminally truncated form of a protein designated T cell replacing factor (TCR) which has B cell growth factor (BGGP II) activity. The truncated protein, deleted up to and including amino acid residue Ala18, can be used, in common with the full-length protein for prevention, diagnosis and treatment of infectious diseases, autoimmune diseases and certain cancers. (Updated on 25-MAR-2003 to correct PP field.)

Coat protein - pepper mild mottle virus (strain Spain)
C;Species: pepper mild mottle virus
C;Saccession: J01315
R;Alonso, E; Garcia-Luque, I.; de la Cruz, A.; Wicke, B.; Avila-Rincon, M.J.; Serra, M.J.
Gen. Virol. 72, 2875-2884, 1991
A;Title: Nucleotide sequence of the genomic RNA of pepper mild mottle virus, a resistant
A;Reference number: J01312; MUID:92113528; PMID:1765765
A;Accession: J01315
A;Accession: J01315
A;Accession: J01315
A;Accession: J01315
A;Accession: J01315
A;Accession: J01315
A;Note: Let authors translated the codon AAT for residue 26 as Ala, CAA for residue 46 in C;Superfamily: tobacco mosaic virus coat protein
C;Keywords: acetylated amino end; coat protein
C;Keywords: acetylated amino end (Ala) (in mature form) #status predicted
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             C;Species: Caulobacter creecentus

submitted to the EMBL Data Library, October 1990
A;Description: Nucleotide sequence of coat protein gene of odontoglossum ringspot virus.
A;Reference number: 514468
A;Status: preliminary
A;Accession: 51446
A;Status: preliminary
A;Nolecule type: genomic RNA
A;Nolecule type: genomic RNA

A64800
purine nucleosidase-related protein ybeK - Escherichia coli (strain K-12)
C;Species: Escherichia coli
C;Species: Escherichia coli
C;Date: 12-Sep-1997 #sequence_revision 17-Sep-1997 #text_change 09-Jul-2004
C;Accession: A64800
